

## CLAIMS

I make the following claims #1 thru #6

1. (Previously Presented)- This invention to be used with existing and new flush tanks that have a water supply and a Float shut-off valve.
2. (Original)- Float 3 moves with water flow and locks in the up position by 9 so full flush can be obtained.
3. (Original)- Partial flush is activated by handle 15 and lever 24 to release float 3 which is held in the up position by 9 which is chained to 12 and lever 24.
4. (Original)- Float is adjustable by threads in 1 & 2.
5. (Previously Presented)- I claim that the basis of this invention is to provide an inexpensive device that will save both water and money.
6. (Original)- I claim that there is no need to disconnect any plumbing.

### Note:

The partial flush valve adapter (claim 3) will be used 80 to 85 percent of the flushings (estimated). Previously presented on my Dual Flush Valve application #10/614,705.

See related applications (sheet #2).
